FortesVMS

An Integrated Video Management System

TOP REASONS TO CHOOSE

Multi-Server Multi-Site

FortesVMS offers multi-server and multi-site solution for expansion of an installation by automatic bridging of multiple FortesServers and FortesNVRs.

Stable and Reliable
VMS preloaded on SSD

FortesVMS high reliability is achieved by both the VMS and Linux® OS hosted on a Solid State Disk (SSD), which provides high read-write speeds and has no moving parts. This also increases system response time, compared to systems which have the OS installed on conventional hard disk drives.

Open Architecture
ONVIF Compliant

Through ONVIF compliance FortesVMS ensures support for a large number of IP cameras and encoders. Compatibility with video streams such as MJPEG, MPEG4, H.264 and H.265 combined with a comprehensive SDK support for third party system integration such as access control and building management systems, makes it a true open architecture surveillance system.

Centralized Storage
Meets your future needs

Centralized storage architecture through iSCSI or Fiber Channel SAN interface makes it efficient with increased performance, minimized downtime and can be expanded easily. SAN storage is ideal for surveillance applications, which involves moving of massive video data streams, as it uses block level system which reduces latency and optimises throughput. Efficient RAID implementation and storage scalability are remarkable advantages of SAN storage, which make installations future proof.

Continuous Operation
Dual Ethernet, Dual Power

Continuous operation and stability are prerequisites to video surveillance applications, to guarantee this, FortesVMS has been designed with support for dual NICs and dual redundant hot swappable power supply.

Zero Downtime
Failover

Failover support for FortesServers and FortesNVRs to ensure continuous operation and maximum system uptime. Servers can be configured for failover as one-to-one, one-to-many or many-to-many option. If one of the server goes offline, the failover server will immediately takeover and manage all of its cameras, users, and security permissions to provide continued recording and access to devices.

Interactive Monitoring
Maps Interface

FortesMonitor client software allows users to use imported interactive maps to visualize the physical location of FortesServers, FortesNVRs, Cameras and Alarms for easy identification and navigation of large surveillance systems. This enables operators to gain situational awareness and quickly respond to incidents.

## User Flexibility
Empowers Operators

FortesVMS empowers operators to control remotely multiple Servers, NVRs and Cameras through FortesMonitor client software. Users can remotely change the camera properties, operate the PTZ camera, have two-way voice communication, promptly search for incidents using timeline and map monitor, scrutinize audit log, export video and pictures, archive video and much more.

Conceptual Overview

An Integrated Ready to Deploy Video Management Solution

Video Surveillance Solution offered by Infinique is of open architecture where a surveillance system can be created to suit a company's current and future requirements. The recording solutions range from an embedded plug-n-play recorder to large enterprise wide scalable solutions with auto bridging using our FortesVMS. The FortesVMS bundled with FortesServer is an optimized integrated solution with pre-installed licenses providing peace of mind and removing the compatibility risks and unavailability of prompt support associated with solutions where VMS software and the hardware are sourced from different vendors.

Along with recording solution, Infinique provides a wide and diverse range of cameras with resolution from 1.4 to 6MP with features such as edge based video analytics, secure transmission using HTTPS, SRTP and protection from unwarranted users with IP Filtering. Together with the cameras and video management system our solutions offer unlimited scalability and are designed to meet the stringent demands of today's security requirement, while keeping it simple, easy to use and maintain.

NOTE: The above network configuration is a conceptual overview only and is not intended to show a detailed network topology. The actual network requirements for your installation will differ based on the configuration, requiring changes or perhaps additional network equipment. Please contact Infinique representative to discuss your specific requirements.

Open Architecture with Centralized Integration
